SCENARIO

“

”

NAME	MATRIC NO	GROUP
IRDINA NADHIRAH BINTI BAHANUDDIN	22C18G026	2

PROBLEM:

Help this person to manage his monthly spending on home loan and car loan by calculating both loans separately. You need to do a problem analysis and design (produce IPO Chart, Pseudocode and Flowchart) for the problems. Try to formulate the formula for both cases based on the sample interface attached.

SAMPLE OUTPUT:

Sample Output:

IPO CHART

INPUT	PROCESS	OUTPUT
Car_Price(RM)	Car_loan_per_month=(((Car_Price(RM)-Down_Payment(RM))*Interest_Rate(%)*Loan_Period(Years))+(Car_Price(RM)-Down_Payment(RM)))/(Loan_Period(Years)*month_per_year)	Car_loan_per_month
Down_Payment(RM)		
Loan_Period(Years)		
Interest_Rate(%)		

Variables: **Flout Car_Price;** **Flout Down_Payment;** **int Loan_Period;** **Flout Interest_Rate;**		

PSEUDOCODE:

Start

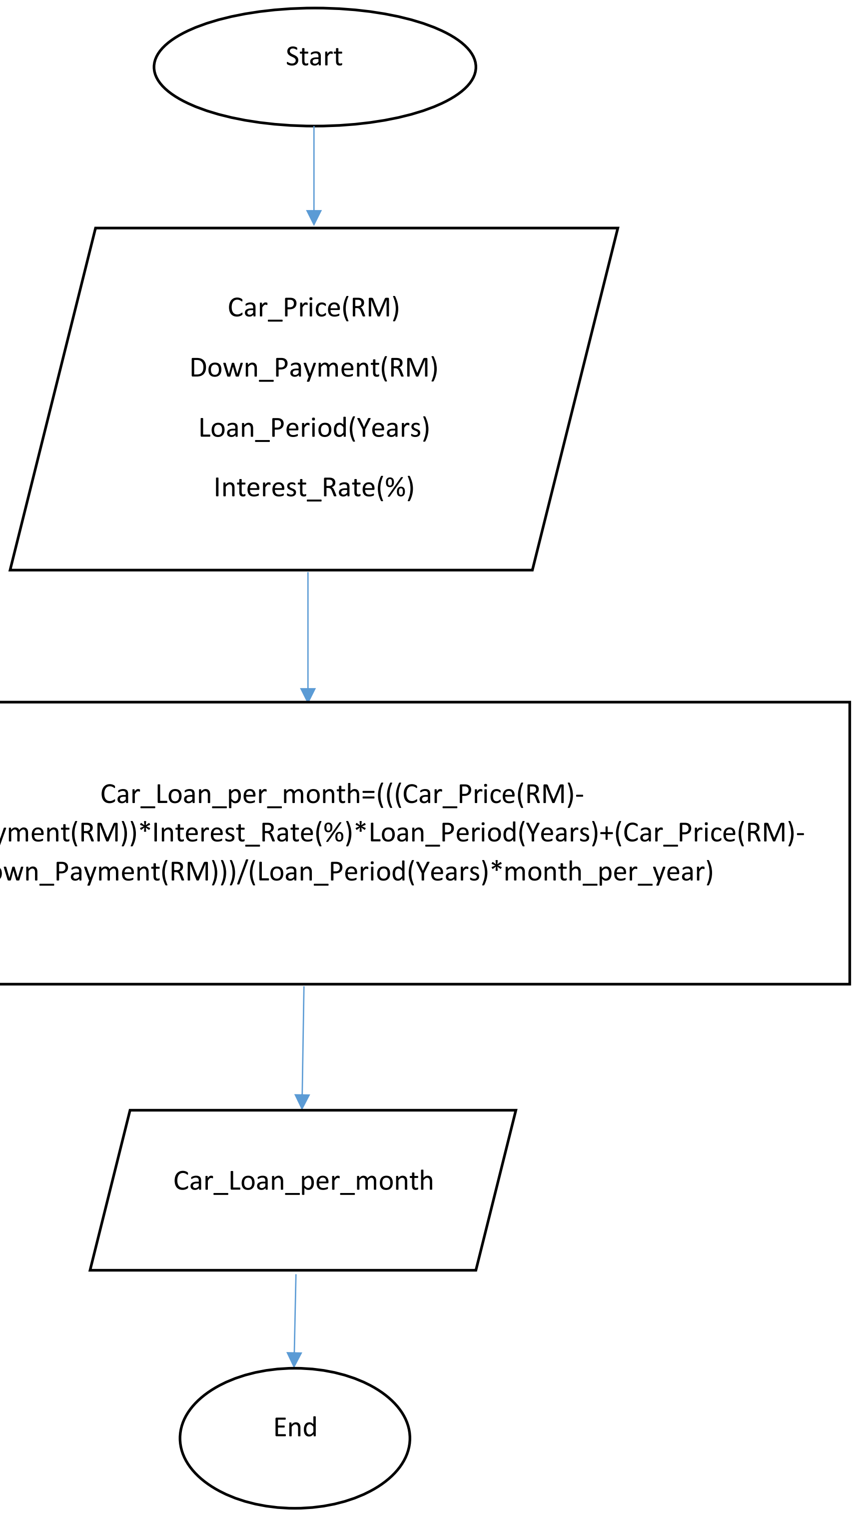
Prompt user to enter Car_Price(RM)
Read Car_Price(RM)
Prompt user to enter Down_Payment(RM)
Read Down_Payment(RM)
Prompt user to enter Loan_Period(Years)
Read Loan_Period(Years)
Prompt user to enter Interest_Rate(%)
Read Interest Rate(%)

Car_Loan_per_month=(((Car_Price(RM)-Down_Payment(RM))*Interest_Rate(%)*Loan_Period(Years))+(Car_Price(RM)-Down_Payment(RM))/(Loan_Period(Years)*month_per_year)

Car_Loan_per_month

End

FLOWCHART:



Start
Car_Price(RM)
Down_Payment(RM)
Loan_Period(Years)
Interest_Rate(%)
Car_Loan_per_month=(((Car_Price(RM)-Down_Payment(RM))*Interest_Rate(%)*Loan_Period(Years)+(Car_Price(RM)-Down_Payment(RM)))/(Loan_Period(Years)*month_per_year)
Car_Loan_per_month
End
