PROBLEM:

In one residential area, Unifi team conducted a survey to 10 houses to determine the choice of Unifi package they offer. Then, once UNIFI package has been selected by all the 10 houses, UNIFI team will identify the number of houses that subscribe to the each of the package offered.

Using loop, write a computer program to receive the input of 10 houses and the choice (refer sample output). It also must cover to put NONE if any house refuses to subscribe. Then, the program also must handle to count of house subscribe to each package.
