PROBLEM:

At a community college, students need to register for a course. A system needs to developed to receive the number of students registered. However, those who are done the registration never show up in the class. This system then needs to calculate the total balance of students left from the students who dropped the course (or not showing up). The unregistered student can still register and it will be updated to the new total of students. Produce the output of new total students.

Assume the output is like this:

Enter number of pre-registered student : 100

Enter number of students adding the course : 5

How many students dropped: 7

Total number of students : 98

Additional:

Find the total of tuition fee paid, when one student need to pay RM72 for this course.

SAMPLE OUTPUT:

Sample Output:

--

IPO CHART		
INPUT	PROCESS	OUTPUT
Pre-registered_student Students_dropped New_students Tuition_fee_paid=72	$\text{Tuition_fee_students} = ((\text{pre-registered_student} - \text{students_dropped}) + \text{new_students}) * 72$	Print_tuition_fee_students
Variables: int pre-registered_student; int students_dropped; int new_students; Float tuition_fee_paid=72; 2;		
PSEUDOCODE: Start Prompt pre-registered_student Read pre-registered_student Prompt students_dropped Read students_dropped Prompt new_students Read new_students Read tuition_fee_paid=72 $\text{Tuition_fee_students} = ((\text{pre-registered_student} - \text{students_dropped}) + \text{new_students}) * 72$ Print_tuition_fee_students End
